Assignment - CA 003

Name   : M.Jasman

Reg.No : 15APC2341

Subject : Enterprise Architecture

Enterprise Architecture CA 003

Question: Describe what are the results of enterprise architecting?

During the process of enterprise architecture, several results can be made. These results are not limited to policies, models and views. For example, evaluate the intermediate results and alternative solutions / directions used to build the enterprise architecture.

- Very useful IT operations. Improved software development support and maintenance costs, increased portability of applications, improved mobility and ability to address critical enterprise-level issues such as easy computing and network management, security and easy upgrade, and transfer of system components.
- Information technology through effective management and research of information. EA helps consolidating and demanding costs in identifying areas, improving executive decision-making, increasing the results from innovation and managing business transformation.
- Enterprise architecture help analyze business models and create an enterprise wide transformation plan portfolio to guide decisions and investments. It also increases the returns on business and information technology investments.
- Better return on existing investment, reduced risk for future investment. Reduced complexity in business and information technology, maximum return on investment in existing business and IT infrastructure, reduced overall risk in new businesses and cost of ownership.
- Enterprise architecture can produce a large variety of tangible and intangible results.

Enterprise can produce many results for enterprises. The actual set of results that should be produced, and the required level of detail and form of the results, depends on the stakeholders and their concerns, as well as the decisions that should be taken based on these results.
